

Amendments to the Claims:

The claims below replace all prior versions and listings, of claims in the application:

Listing of Claims:

1. (currently amended) A system comprising:

a personal computer comprising a web browser that provides communication between the personal computer and the Internet; and

a peripheral device capable of being coupled to the personal computer, that wherein the peripheral device comprises a device driver and firmware that contains a uniform resource locator (URL) that identifies a location on the Internet ~~and is used to direct the web browser to a location on the Internet~~ where appropriate driver software is located and available for downloading and installation on the personal computer;

wherein, when the peripheral device is connected to the personal computer, ~~the URL launches a browser on the personal computer which is directed to the Internet location~~ an embedded web server in the peripheral device configured to serve web pages is used without user interaction to access the URL containing the driver software ~~[[.]] to automatically download[[s]]~~ the driver software to the personal computer, and automatically ~~launches and installs~~ launch and install the downloaded driver software on the personal computer for automatically configuring the peripheral device to work with the personal computer without user interaction and without the user specifying any option selections;

wherein ~~[[computer specific operating system information,]]~~ printer-specific information including specific model variant, and other model-specific information is encoded in the URL and communicated from the firmware to a server associated with the URL and used to specifically tailor the driver software to be downloaded;

wherein information regarding the type of personal computer and its operating system are transferred to the Internet location using header information provided by the web browser;

and wherein the firmware periodically accesses the URL to check for critical updates.

2. (original) The system recited in claim 1 wherein the peripheral device comprises a printer.

3. (original) The system recited in claim 1 wherein the peripheral device comprises a scanner.

4. (original) The system recited in claim 1 wherein the peripheral device comprises a camera.

5. (original) The system recited in claim 1 wherein the peripheral device comprises a plotter.

6. (original) The system recited in claim 1 wherein the peripheral device is coupled to the personal computer by way of a local area network.

7. (currently amended) A method for use with a system comprising a peripheral device and a personal computer having a browser that provides communication, the method comprising the steps of;

configuring the peripheral device to have firmware comprising a uniform resource locator (URL) to an Internet location where appropriate device drivers for the peripheral device are made available for downloading;

~~using the URL and the web browser to automatically connect the personal computer to the Internet location holding the device drivers;~~

automatically connecting the personal computer to the Internet location holding the device drivers using the URL and ~~the web browser~~ an embedded web server in the peripheral device configured to serve web pages for accessing the URL without user interaction immediately after the peripheral device is connected to the personal computer;

communicating information regarding the type of personal computer and its operating system to the Internet location using header information provided by the web browser;

downloading a driver installation package containing a device driver for the peripheral device from the Internet site to the personal computer using the web browser that is appropriate to the personal computer and its operating system and that is capable of implementing a driver installation process without the user specifying any option selections;

automatically initiating the driver installation process upon receipt of the driver installation package to install the device driver for the peripheral device on the personal computer;

encoding~~[[~~ computer specific operating system information,~~]]~~ printer-specific information including specific model variant, and other model-specific information in the URL and communicating from the firmware to a server associated with the URL for specifically tailoring the driver software to be downloaded; and

periodically accessing the URL with the firmware to check for critical updates.

8. (original) The method recited in claim 7 further comprising the step of:
notifying the user when the driver installation process on the personal computer
is complete.

9. (previously presented) The method recited in claim 8 wherein the notifying
step uses executable software code commands.

10. (currently amended) The method recited in claim 7 wherein the step of
periodically accessing the URL comprises the step of using executable software code
commands.

11. (currently amended) The method recited in claim 7 wherein the step of
periodically accessing the URL comprises the step of providing access via an
embedded web server in the peripheral device capable of serving web pages..

12. (original) The method recited in claim 7 wherein the peripheral device
comprises a printer.

13. (original) The method recited in claim 7 wherein the peripheral device
comprises a scanner.

14. (original) The method recited in claim 7 wherein the peripheral device
comprises a camera.

15. (original) The method recited in claim 7 wherein the peripheral device
comprises a plotter.
